Strawberry Plants

That Grow

Season of
1919

The Fall-bearing
Progressive

C. E. Whitten's Nurseries
Bridgman, Michigan

EATON A NEW SEEDLING STRAWBERRY TO BE INTRODUCED IN THE SPRING OF 1920

We received this new seedling from an old strawberry grower of LaFayette, Ind., Mr. A. V. Eaton by name, who found it among some wild ones growing in an orchard, and has fruited it for several years. He thinks it may have been crossed with Sen. Dunlap, as he says the best berries of each are similar, but the likeness stops there, for Eaton is very distinct in every way.

The foliage is very rank and strong, some of the leaf stalks measuring eighteen inches, with fruit stems in proportion. The berries run very large, a perfect cone, and hold this shape to the last.

Mr. Eaton says he has never seen a misshapen berry, and no buttons, white or green tips. It is very drought resistant, and as good a plant maker as Dunlap, with much heavier and stronger growth.

As grown by him and a few of his friends, this berry has been superior to any of the list of standard varieties tested by them.

Mr. Wm. Dyke, of Illinois, says of his 1917 crop: "The Eaton kept up its record with us and was in good demand at fifty cents per crate above all others. The berries were uniformly large and solid, although the rows were a little too thick. Plants should be set at least two feet in the row, as they will make a solid row at that distance." Mr. Dyke also writes of his 1918 crop: "The Eaton strawberry was best again with us and there is no mistake about its being a better all around berry than anything we have had, the old standbys having to give way to Eaton."

Mr. Eaton first sent us a few plants to try out in the spring of 1916, and the following season we fruited these under rather unfavorable conditions, as they were turned upon in cultivating an adjoining field. Notwithstanding this ill treatment the showing of fruit was exceptionally fine, making a heavy yield of very large and handsome appearing, excellent quality berries.

At that time we had made no arrangement with Mr. Eaton for the introduction of this variety, so did not make any attempt to increase our planting, and for that reason we had nothing to fruit the past season. However, Mr. Eaton sent us plants again last spring which we have grown as a propagating bed and will plant in the coming spring, and shall expect to have a good supply to offer to our customers in the spring of 1920.

Our illustration is made from kodak films sent us by Mr. Eaton, and represents himself with baskets of Eaton berries, also the rows of vines from which the berries were picked, showing the large size of fruit and the very heavy plant growth.

In trying to be strictly honest, we find that we have not said all that might have been truthfully said of its good qualities, for Mr. Eaton tells us that he has not discovered anything he would consider a fault in the several seasons he has fruited this sort.

We hope all our friends will give this new berry a trial when ready for dissemination and feel confident that they will be pleased with it.

GREETING

Again we are sending our Annual Booklet, "Strawberry Plants That Grow," which is our "Traveling Salesman." In it we shall endeavor to describe our location, our method of doing business, list of varieties and **truthful description** of their qualities.

We are located in the section of the country known as the Great Fruit Belt of Michigan. This locality seems to be especially adapted to the growth of Strawberry and other Small Fruit plants.

Our soil is mostly a sandy loam, giving a strong root growth, yet being very easily handled in digging, and for that reason our plants have a fine root system, and we are able to prepare them for shipment in the best possible manner.

We have spent our lifetime in this business, commencing over thirty-six years ago, in our present location. This is the 29th annual list we have mailed to prospective customers. It has never been our idea to make the extravagant claims for our business that some growers do, and perhaps we have been too conservative in the past.

We know that we grow our plants just as scientifically as anyone can, and take great pains to keep the varieties pure and true to name. We also know that we can furnish plants the equal of any, and superior to a great many being offered for sale, and think our prices are reasonable, considering the quality of our stock.

Our business is almost wholly confined to the retail or grower's trade, as we have made no effort to supply Wholesale Nurseries or Dealers, preferring to grow the **best stock** possible, and to deal direct with the grower. By giving this work our personal attention, we feel that we have in the past, and hope in the future, to be able to please our customers, by furnishing stock that will grow and bear fruit of the best quality.

We made our plans for this catalog early in the season, while the Government was urging conservation, so have not made any elaborate effort in its makeup.

At this time, as we are preparing matter for the printer, the Great War is apparently over, and the whole world is interested in the Peace Conference soon to be held in France. Whatever the result may be, or whatever terms may be made, it is evident to all that our country must feed the world, or at least a large portion of it for some time to come, and our fruitgrowing friends can show their Patriotism in no better way than by growing an extra amount of fruit for consumption.

Also many home gardens of our town and city friends may be made to supply their tables with a large portion of their fruit and vegetables if proper care is taken in planting. Perhaps the quickest returns would come from setting the Fall-Bearing Strawberry the coming spring, and be able to pick ripe fruit from August to Thanksgiving. The bush fruits may be grown readily, but will take a little longer to come into bearing. Also asparagus and pie-plant are both easily grown.

There is a decided shortage of plants in all sections for the coming season's trade, owing to heat and drouth during August.

This is especially true of all raspberry tip plants, both purple and black, as the weather was very hot and dry at the time these should have been layered, and many growers did not attempt to put them down at all. As a result the shortage of these varieties is great, and we give you this as a "tip," if you want tip plants, best place your order early. Our plants are strong and well rooted, although less in number.

Everything that enters into the cost of production in our business has advanced to such an extent that we have been forced to advance our selling price more or less on all varieties, yet we think you will find our prices are as low as anyone can offer on stock of equal grade.

It will be a great help to us if our friends will speak a good word for our plants, if they have the opportunity, and it will be thoroughly appreciated.

If more than one catalog is received, please hand to some one whom you think will be interested in small fruits.

Please read very carefully our "Instructions to Purchasers" on page 16 before making out your order, also be sure and use the Order Sheet enclosed, writing postoffice, county and state very plainly.

Please sign your name plainly; we can guess at anything else easier than proper names.

How to Set and Grow Strawberries

THE SOIL and location best adapted to strawberry culture will vary somewhat in different sections. In a general way we have said that any soil that would grow good crops of corn or potatoes would grow good strawberries, and while this seems to be a pretty safe rule, it is also true that in order to grow them to the best advantage it is necessary to have the soil especially adapted. One of the first requisites of the ripening fruit is moisture, and care should be taken that this is provided. Hence a very dry or loose, sandy soil would not be a safe location, although in moist seasons a fair crop might be harvested. Neither is a stiff clay adapted to strawberry growth, as very early in season it cannot be worked without becoming cloddy, and late is apt to bake, and the plants will suffer more than on sandy soil. It would seem that a sandy loam or loam with slight mixture of clay should if properly handled give the best results.

Drainage—Having chosen a soil retentive of moisture, it next becomes necessary to prepare for proper drainage in case of excessive rainfall, unless the natural lay of the land is such that no water will stand upon the surface. Tile drains, which are quite practical ones to use. Open ditches will, perhaps answer this purpose, but are unsatisfactory in many ways.

Frost—In planning your strawberry field care should be taken to avoid frosty locations, such as very low land near marshes or lakes, also valley where there is no chance for circulation of air, as these localities are very liable to heavy frosts, when higher land or that more open to circulation would show little, if any. A hard frost at blossoming time often ruins the entire crop.

Manuring—Where the soil is at all deficient in fertility, I would advise using well-rotted stable manure. If this can be applied to the soil a year previous and some cultivated or hoed crop grown, then the following season the land must be in the best possible condition for setting strawberries.

Some writers advocate the plowing under of a clover sod in preparation for this crop, but I am always doubtful of this method on account of the white grub, the larvae of the May beetle, which is quite apt to infest such soil. Perhaps if only recent seedings were so treated, the pest would not trouble, but I would warn all against plowing up an old sod to set strawberries, as the grubs would be almost sure to destroy the greater portion of the plants set. Never plow under green or very coarse manure just before setting strawberry plants, as it would cause the soil to dry out very quickly and will also burn the roots, killing the plants wherever it comes in contact with them. This is important and should be avoided if possible. Any good commercial fertilizer may be used. This should be sown broadcast on land after plowing, and well harrowed in.

Fitting the Soil—Begin by plowing as late in the fall as possible before the ground freezes. This late plowing is beneficial in that the soil lays up loose and open that frost may act upon it more readily, also leaving it in condition to absorb more moisture in the spring which may be drawn upon later in the season in case of drouth. It also tends to kill a great many insects which live over winter in the soil, some of which are quite troublesome and injurious to strawberry growth.

Plow as deep as practicable, eight inches at least, unless this brings the subsoil to the surface, which should not be done under any circumstances. As soon in the spring as the season has fairly opened, just as early as the soil will work up mellow, the land should be thoroughly harrowed, followed immediately with a heavy roller or plank drag. This firming the soil is important, as it is almost impossible to set plants properly if the soil is not reasonably level and firm at the surface. If the surface soil should become too dry and loose it may be necessary to wait for a shower before setting the plants.

Marking Out—This may be done in any manner that will give a very shallow, straight mark to set by. A light sled marker that will make three or four marks at once is very handy, and could be made by almost anyone. In garden culture a line may be used.

Hill Culture, which consists of growing the single plants, cutting off all runners as fast as made, which causes the plants to "stool out" or grow additional "crowns," which will each produce fruit stems, the rows should be from two and one-half to three feet apart and sixteen to eighteen inches in the row. If to be cultivated both ways, or in checks, two to two and one-half feet would be right. I would recommend this method to all those who wish to grow fancy berries and are willing to give the extra culture needed. This system requires a rich or fertile soil.

The Hedge Row is quite similar to hill culture. The rows should be from two and one-half to three feet, and twenty to thirty inches in the row; the freer runners the greater distance. The first runners are turned

into the row and held in place with soil until they have struck root, generally about every six or eight inches in nearly a straight row, later all extra runners are kept cut off. This is easily done with a good sharp hoe.

The Half Matted Row should be set about three and one-half feet apart and eighteen to twenty-four inches in the row. The runners are all kept off until about the middle of summer, then allowed to root until row is about one foot wide, after this all runners should be cut off. This gives a fine show for fruit.

The Matted Row is the system adopted by the greatest majority of fruit growers, although without doubt other methods would prove more profitable. The rows are set four to four and one-half feet apart, and plants from twenty to thirty inches in the row. The runners are all allowed to root, running the cultivator always in the same direction and narrowing it up as required. At times, if the season happens to be favorable to plant growth, and the soil is rich, almost the entire surface will be covered with plants. This method might be allowed on poor soil where fewer plants would be grown, or with varieties that make few plants.

Setting Out—We use a common garden spade for opening the holes, which is done just ahead of the setting, not leaving them to dry out. In doing this the operator proceeds along the row, thrusting the spade in the center of the mark already laid out, spacing equal distances according to methods chosen, quite close if to be grown in hills, and further if for matted row.

This should be nearly the depth of the spade, and if the soil is properly prepared this will not require much effort, but if the soil should be very solid, it will require some pressure of the foot.

The spade should be given a slight motion away from, then be kept toward the operator, toward the withdrawal. If the conditions are right, you will have a V-shaped opening which will readily receive the roots of the plants. Care should be taken not to weave the spade back and forth too much, as this tends to open too wide a space at the bottom of the hole, making it hard to close properly, and leaving a chance for air space, causing plants to dry out and die.

The greatest pains should be taken in getting the plants into the soil, and here is where you should place your most careful workmen; or better still, do this part yourself, if possible. Have the plants set in a shallow basket or other receptacle, with the roots moistened. If the roots are very long they should be cut back to about three inches. The plant should be held by the upper part of the crown, and placed in the spade opening at about the same depth it grew, which would bring the crown even with the surface; now let the operator press the soil firmly against the plant with a good strong pressure of the foot, being careful to see that the opening is entirely closed that air may not enter and dry out the roots.

Cultivation—As soon after setting as practicable, the surface soil should be stirred very shallow, being careful not to disturb the roots of the plants, also not to cover up the crown or heart of the plant; the latter will cause the plant to die, especially in damp weather, by rotting or smothering the crown. This early cultivation is essential for several reasons: First, to be sure that all the openings near the plants are filled, also to preserve moisture if the weather is dry, by arresting evaporation through capillary attraction. This cultivation should be kept up through the season, never allowing the surface to crust.

However, it is necessary to do some hand work with the hoe in order to loosen all the surface and keep down weeds. The latter is very important.

The blossoms should be pinched out of all spring-set plants, as it is not advisable to let them ripen fruit the first season, as it weakens the growth of the plants and is liable to kill them outright.

All runners should be cut off until the first of July, when if matted row is wanted, the runners may be allowed to root until the desired row is obtained, after which all runners should be kept trimmed off.

Mulching or Winter Covering—As soon as growth ceases in the fall, and before ground freezes hard, the surface of the field should be well covered with some sort of mulching. Either long straw, wild hay, corn stalks or other litter, if free from foul weed seed, will answer the purpose. I would advise spreading hay or straw when slightly damp, if possible, and place a little soil upon the top at short intervals, which will help to keep it in place in case of high wind.

Some advise using coarse stable manure as a covering, and if free from grass seed, this might be advisable, as it would both fertilize and protect the vines from frost. However, I generally "fight shy" of stable manure on plants that I wish to fruit the second season or for longer period, as I have sometimes seen a good stand of clover and timothy on what was supposed to have been a strawberry bed. As soon as growth commences in the spring this covering should be taken nearly or entirely off the plants, but may be left between the rows as a mulch to preserve moisture, also to keep the fruit clean at picking time.

Fall-Bearing Strawberries

Fall-bearing Strawberries have become so well known at this time that most people recognize them as distinct species; however, we oftentimes hear some one say, "Oh, yes, my Dunlap or my Bubach had a fall crop this season." Of course this sometimes happens, but it is quite a different thing from the regular fall-bearing varieties.

We have mentioned in earlier catalogs how Samuel Cooper of New York found the first fall-bearing strawberry plant away back in 1898. This he named Pan American, in honor of the Buffalo Exposition. From this variety and its seedlings have sprung all the fall-bearing sorts in America today.

The fall-bearers require a soil of good fertility, if not naturally rich, then add fertilizer; we find nothing better for this than well rotted stable manure worked into the soil during the fall previous to setting in the spring. Then, too, cultivation must be continued until the close of the growing season if you would have best success. This constant cultivation will make dirty berries in rainy season, but is necessary if you want the best growth of fruit and plants.

Progressive

(Per.)—This is the one really "**Fall-Bearing**" variety, as this sort will bear a heavy crop during the Fall months on plants set the previous April.

Other varieties will bear a few berries the first Fall, but you must wait until the following year for a crop, and then if you let plants bear the June crop, as they will unless disbudded, they are so exhausted that the Fall crop is much smaller than the **Progressive** gives the first season.

I claim that the **Progressive** grown for the one season's crop, that is, set a new bed each year, will pay better than to grow the other sorts that you have to wait a year for your returns.

I have made this claim for several years, while others were trying to push other varieties, but of late most of the plant growers have come to the same conclusion and give **Progressive** first place in their catalogs.

Superb is really the only sort in this class that can be considered as competing with the **Progressive**, and although it is a larger berry, it will not stand shipment as will the latter. As a June variety it does excel, but why pay the price when we have so many better June sorts. I am not knocking the Superb, for we are growing plants of that variety to sell. I give it as my honest opinion of the comparative merits of the two varieties, considered as Fall croppers, from personal experience.

We have grown the two varieties side by side, and have picked crates from the **Progressive** where we did not pick quarts from the Superb, during the first Fall. We find that it pays to have the soil well enriched where growing the Fall-bearers, and also that constant cultivation is essential.

We find that **Progressive** is the best shipper, holding up for long distance shipping, equal to almost any of the June sorts, and in flavor and quality is equal to or surpasses any of the fall-bearers that we have tested.

I do not hesitate to urge all to try these berries, for I know you will be pleased. Some of our friends seem to be afraid that they will not succeed with them, but anyone that can grow the June sorts successfully can grow these. The only difference in culture is that you must keep the bloom picked off until about the middle of July for best results.

Superb

(Per.)—Some call this the best of all the fall-bearers, but I give it second place, considered commercially, for the reason that the **Progressive** bears so many more berries the first season.

However, **Superb** is a good berry and will bear a heavy crop of fine berries in June of the second year and if given right treatment, by which I mean clean culture and extra fertilization, it will begin ripening another crop in August and continue until covered with snow, or destroyed by hard freezing, the first frosts do not injure it much, as the fruit is mostly under the foliage.

Superb is the larger berry, but does not stand up for long distance shipping as well as **Progressive**, especially in very hot weather. However, as a home berry or for near market it is fine, and where space is limited as it usually is in town or city homes, this is an ideal variety to grow, giving, as it does, nice ripe berries from June to Thanksgiving.

Strawberries

Perfect Blossom.

All strawberry blossoms are either staminate—also called perfect—or pistillate, generally called imperfect.

The imperfect varieties, which are all marked (Imp.) in catalog, should have a perfect variety, marked (Per.) set every third or fourth row to properly pollinize the blossoms of the imperfect sorts.

There seems to be a mistaken idea with some that this mixing of varieties is necessary with the perfect as well as the imperfect sorts; but this is not so. The perfect sorts are self-pollinating, and will bear as well if set by themselves.

Imperfect Blossom.

Early Varieties

Campbell's Early

(Per.)—This is an extra early variety from New Jersey, first offered to the public last season, and the introducers claim it to be the "greatest of all early Strawberries." Earlier than Michel's Early, making large healthy plants with a light green waxy upright foliage protecting the great crop of large beautiful rich red berries, which have a bright green calyx and are second to none in flavor. As large as Gandy and more prolific.

Its most wonderful feature is that practically all grow to full size with no knotty or ill-shaped berries, ripening perfectly all over with no green tips.

While this sort is a good strong grower, it is not an excessive plant maker but sets only a good fruiting row.

We received our stock from the introducers last spring and have not seen it in fruit. However, we are pleased with its general appearance and manner of growth and offer it to our friends on the recommendation of the introducers.

Above was our last season's description and we sold so short that we had no chance to see it in fruit, but were very much pleased with its manner of growth, making as it does such a stocky and strong plant and without the surplus of runners that most early varieties have. From reports from other growers we believe this sort has merit and urge all to test it for early market.

The Luther

(Per.)—Luther, or August Luther, as some prefer to call it, was originated by Mr. A. Luther, of Missouri, and grown by him for several years before it was offered for sale. I shall still place this variety at the head of the list of **extra earlies**, as I have found nothing yet that I consider better. It has a very pleasing appearance, being of a very bright red color and almost always of perfect shape, a slender, rather sharp pointed berry. It ripens evenly, no "green tips," and will ripen its full crop in a short space of time, this feature making it a good market sort. It is also a very thrifty grower, making a full row of medium sized plants.

This season we have a good stock of well-rooted plants, and I shall recommend it to all wanting a very early berry.

I have dropped both Excelsior and Missionary from our list, not because they were poor varieties but rather were more especially adapted to the South than to this latitude.

As I have said before I have found nothing better than **Luther** for first early market berry, and I do not hesitate to recommend it as such.

Bederwood

(Per.)—This is generally conceded to be one of the very best early varieties for home use or market. It is a splendid grower, making a large number of strong runners. It has a perfect blossom, and is **immensely productive**. Fruit of good size, light red, medium firmness and good quality. One of the best to plant with early blooming pistillate varieties.

While this sort could hardly be classed as a **firm** or **hard** berry, it has a peculiarly dry or spongy nature which enables shipping it long distances without injury. It is an excellent plant-maker, setting freely and rooting deeply; thus being able to withstand drouth. I should like to emphasize what I have said in its favor and again recommend it as a paying market sort.

Lovett

(Per.)—No person need hesitate to plant this variety for either home use or market, as it succeeds generally in any soil or locality. It is one of the tough, hardy varieties that will never disappoint the grower. It has a perfect blossom and bears heavily. The fruit is of medium to large size, conical, firm, and of good color and quality. One of the best to use as a pollinizer for pistillate sorts.

Senator Dunlap

(Per.) — In other years I have tried to describe this variety and have said that it might be called a perfect flowered Warfield. Although it is very distinct it is quite similar in form and color of berry, also in manner of plant growth.

If grown on very strong and moist soil in matted row it will be disappointing, as it will set too many small plants, and the berries will be small and of poor quality; however, if kept in a narrow row, the fruit is large and of high quality.

The introducer of this variety had this to say of it when first offering it:

"We have the greatest confidence in this variety and believe that it will in the near future take its place among the more prominent standard kinds. The plant is almost perfect in its way. We have several times called attention to its toughness and ability to endure hardships. It is small, slim, very deep-rooted, and as great a runner as the Warfield. With us it has always proven very productive. The fruit is generally large, never of the largest size, however; is conical in form, regular, never misshapen, bright or slightly dark red, very glossy, firm, a splendid keeper and shipper, most excellent in quality and one of the best canning berries we have ever known. Its season is second early and it bears a long time."

The elapse of time has fulfilled his prophecy for today there is no known variety that is so universally popular nor one that is so extensively grown as the Senator Dunlap.

I have always recommended Senator Dunlap, for either market or home use, and I wish I were able to describe its merits more fully; however, no one can make a mistake in testing it, as it is one of the best, making an excellent pollenizer for second early sorts, or doing equally well planted alone.

I have no hesitation in saying that if I were confined to one variety this would be my choice.

I do not mean to say that I think the quality of the berry is the best of any sort, but all things considered, health and vigor of plant, its fruitfulness, good color and quality of berry, together with its long season of ripening—from early to late—make a combination hardly equaled by any other sort we have tested.

Some one has said that this was the safest variety for the new beginner, as it would bear fruit in spite of neglect and ill treatment, and while this may be true in a degree, it is also true that it will well repay the most careful culture.

When properly grown it is of excellent quality, a strong grower and prolific bearer.

It should be grown on strong soil, but the plants should not be allowed to mat too thickly, hence a large part of the runners should be removed as they form.

Given an open row where the sun and air can reach the berries, this variety is sure to please, as it is a very heavy bearer of deep red fruit of handsome appearance and best quality. It is a long season variety, commencing with the second earlies and lasting well towards the end of the season.

Dr. Burrill

(Per.)—This is a new variety, being a scientific cross between Crescent and Sen. Dunlap and the result of experiments by that veteran plant breeder, Dr. J. R. Reasoner of Urbana, Ill., who originated Sen. Dunlap and by him considered to excel that wonderful variety, which it very much resembles in plant growth.

As yet, I have not seen it in bearing, however the introducers claim the berry is very distinct, being of a brighter red color, of better quality, and an excellent variety for canning, surpassing Warfield for this, according to some of our best growers who say the flavor is milder and more delicious than Sen. Dunlap.

The berries are excellent shippers and good keepers, the calyx is a bright green and the seeds are yellow, making a beautiful color combination.

This variety is strongly staminate with a long blooming season making it an especially good pollenizer for pistillate sorts. In plant growth it is remarkably strong and healthy with very deep root system making it a great drouth resister. Its foliage is large and brilliant dark green, very tough and resistant to disease.

While it is a very heavy runner or plant maker, it will grow heavy crowns if kept in hills and does remarkably well when grown under that system, although doing equally well in a light matted row, however it will not do its best in fruit, if allowed to set too many plants and we advise cutting runners freely.

Senator Dunlap.

Warfield

(Imp.)—This variety is still very popular as a market sort, although the Senator Dunlap has practically usurped its position at the head of the list, which it held before the advent of that very popular sort. The two together make a good team, and are quite similar in appearance when in the crate. In plant growth this variety is quite similar to Senator Dunlap, except it does not root so deep on light sandy or gravelly soils, and is more liable to suffer from drouth. While the individual plants are quite small and usually have only one fruit stem, it is remarkable the number of quarts produced by a lightly matted row on good strong soil.

Warfield cannot be excelled as a canning berry; indeed, my wife says that it is not equaled by any of the sorts we list. It is quite tart, but of good rich flavor, not simply sour, and has a very deep red color; which it holds after canning.

Charles First

(Per.)—This new early variety is a seedling found by one of our growers, Mr. Geo. Hann, several years ago, and later introduced by Mr. Baldwin, who gives it this description: "Charles First ripens nearly a week ahead of Michel's Early,

and is very productive, yielding more quarts of large, fine looking berries than any other early sort. It is a strong fertilizer and a good grower. Berries are large, regular in form, and of good color and quality. This valuable early strawberry continues to produce large, fine looking berries till the last pickings."

Helen Davis

(Per.)—"The plant is a strong, vigorous grower, with tall, healthy foliage, and has never shown any sign of disease; the runner wires are large and strong and just the right length to layer properly without crowding. The fruit stalks are large, some growing as large as a lead pencil in diameter. The fruit is held up from the ground by the strong stems and is easily gathered. The fruit grows in clusters, some stems having as many as thirty berries on them, with as many as ten fruit stalks to the plant. I have had single plants that a bushel basket would not cover.

"One great feature of this plant is that there are never any blank plants, every plant, no matter how small, has a fruit stalk. I have never seen a plant equal it in this respect.

"The fruit is large and attractive and holds up well in size throughout the season. It commences to ripen with Dunlap and ends with Sample. Have picked berries from it as late as the 4th of July. It is a light crimson color which extends clear through, and has a flavor which cannot be excelled. The berry is sweet, and is a fine berry for canning. It is a heavy cropper, and will yield twice as many perfect berries as Glen Mary. It is a perfect flowering variety, and is a strong pollenizer for imperfect varieties.

"One strong point in favor of this variety is that every berry is perfect and smooth, no knotty berries. It will go through hard frosts and bear a good crop of fruit.

"It is a thrifty grower and very prolific bearer, and in favorable weather it makes a good market sort." (Introducer's description.)

Haverland

(Imp.)—This is one of the best-early market sorts, and seems to do well in all sections. It makes a thrifty plant growth. Berries are large and of a peculiar longish shape, though very regular and even, holding out well to the end of the season. The color is rather light red, which may be considered a fault by some, but they make such a handsome appearance in a box or basket that they nearly all sell at top prices in market. About the only weak point that I have discovered in the Haverland is that the fruit stems are tall and unable to stand up under the weight of fruit as it ripens, consequently they should be mulched with straw to keep them from the dirt. This peculiarity of growth makes fine picking, as the berries lay out in sight, requiring no movement of the vines to find them. Another good point in their favor is the ability to withstand frost at blooming time, often bearing a full crop of perfect fruit when other sorts are badly damaged. There is such a demand for plants of this variety that the supply nearly always fails.

There have been a great many spurious or mixed plants sent out from this section as Haverland; we warrant ours true to name. If you are unacquainted with this sort, try a few and see what a fine market berry they are. A little too soft for distant shipment, but they will stand picking before fully ripened and will color up in the crate after picking. If handled in this manner, Haverland will stand shipment as well as any of the larger varieties.

Bubach

(Imp.)—Fruit large and handsome, roundish, conical, bright scarlet, moderately firm, of fair quality. Plant a strong grower, with a large healthy foliage and very productive. Succeeds on light or heavy soil. Desirable for home use or near market. One of the best. Season early to medium. This is an old standby, and is deservedly popular. In plant growth it is vigorous, but does not throw out excess of runners, hence it is best grown in hedge or half-matted rows.

Midseason to Late Varieties

“Collins” A New Strawberry
Originated at Bridgman

(Per.)—This new variety was originated here, and first offered to the public by me in the spring of 1915. As we have sold only in limited quantities, there are very few plants for sale of the **genuine** stock, and my advice would be to buy of the introducer.

I will repeat part of our original description:

"In offering this new Strawberry at this time I feel that I have something that will be an acquisition to our list of market sorts, and is also of such **superior quality** that the amateur will be delighted with it. Now let me say something of its origin: Back in 1909 my next door neighbor a Mr. C. H. Collins, (an old soldier of the '60's by the way) planted seed from a fine appearing berry picked from a Bederwood plant, saving three plants from these seedlings. Our berry was one of these and I saw it fruiting in 1911, and have had it under observation each year since. While its direct parentage (Bederwood) was plebian it must have had **blue blood** from some other source, for the plant growth, while showing unmistakable features of Bederwood type, still is of much stronger growth, making a good row, but it is not the excessive runner that Bederwood is; the foliage stands up very strong and rank, of rich dark green color, and is free from rust or disease."

The fruit stems are strong, holding the berries well up from the soil, also the berries are of much better color than Bederwood, being a deep red, and of good rich flavor, ripening evenly without green tips.

The "Collins" is strongly staminate, making it a good pollinizer for pistillate sorts. While we shall call it a mid-season variety, it covers so long a period of ripening that it really begins with the second earlies and continues well along with the latest sorts, bringing practically every berry to perfection.

We have fruited good sized blocks of this variety and it really has been our best cropper, although we have not given it "ideal" culture, as in growing for plants we have let the rows mat too heavily. For best results on strong soil the runners must be restricted. When properly grown the berries are of good size and color, with absolutely no "nubbins" or "buttons."

The only real fault that has been found with this sort, so far as I have been able to learn, is the tendency to set too many plants when not restricted, causing the berries to run smaller. I wish to urge all my friends to give this sort a trial and feel safe in promising that you will be satisfied with it either as a market berry or for home use.

The "Collins" seems well adapted to the "hill" system of culture and by this method very remarkable results may be obtained, as quality and size of berry are very much improved and on a strong soil this is the "ideal" method.

The past season was not an ideal one for strawberries, most of our standard sorts failing to ripen the usual crop of fruit for some unaccountable reason. Notwithstanding this condition our Collins rows seemed to set the usual number of berries although somewhat smaller than usual but really giving us better returns than any other we fruited.

William Belt

(Per.)—This is one of the old standbys which came from Southern Ohio several years ago and was named for the originator and later introduced to the public by that veteran grower, M. Crawford, perhaps the oldest living "Strawberry Specialist."

From the first it has been considered one of the best in flavor and is very beautiful in appearance, being bright red in color. The first berry to ripen on each stem is apt to be cockscombed or "butterfly" shape, our cut giving a very good representation of these first berries which are very large and fill the quarts very fast. The later ones to ripen are more evenly conical.

In plant growth it is superior, making very strong plants with abundant and healthy foliage, and sets just enough runners to make a good fruiting row.

In its first introduction there was some complaint of this variety "rusting" but of late I have seen very little rust, in fact we have never known it to affect the fruit crop.

I wish I might be able to impress my prospective customers with the excellency of this sort, both as a market variety and for the home garden.

It is a very heavy and abundant bearer of fine appearing fruit of the **very best** quality and we find it much superior to many of the more lauded new sorts.

We have only a fair stock of this variety to offer this year and would advise placing your orders early.

William Belt.

 **SEE PAGE 17 FOR PRICE LIST.**

The Famous Gibson

(Per.)—This is not the old variety of that name which originated in Eastern New York several years ago, but it is a local berry of great promise and more nearly resembles the Pocomoke than any of the older sorts which I am acquainted with.

It commences to ripen with the second earlies and continues for a long season, making a heavy yield of fruit.

The fruit stems are large and strong, and the dark green foliage is an ample protection for the blossoms and fruit; having a strong staminate bloom, it makes a very good pollenizer for pistillate varieties.

The berry is large and regular in shape, holding its size well to the end of the season; its color is a deep, rich red all through from surface to center; its flavor is fine, being neither too sweet nor too sour; but just right for table or canning.

In manner of plant growth it very closely resembles **Pocomoke**, making a heavy row of very strong and healthy plants, its foliage being of a very dark and glossy green, not a speck of rust to be seen on our rows this season.

It is very hardy in bud and bloom, withstanding spring frosts that very nearly wiped out such varieties as Bederwood and Warfield on adjoining rows.

I cannot give the parentage of the **Gibson**, neither can I give its exact origin, but it seems to have originated in our county (Berrien), having been grown by a colony of German farmers who kept it to themselves for several seasons, making big money out of it. Finally it became known and other growers have been able to fruit it until at present time it has become very popular with our market growers.

The above is taken from our earliest description and I still think it is one of the best market sorts we list.

It seems identical with **Pocomoke** and hereafter I shall list only the one sort. This should not prejudice anyone against this variety, as under either name you will find a first-class berry.

In the Bridgman Fruit Growers Association there are more acres of **Gibson** grown, by far, than any other variety; this should prove its desirability as a market berry.

It is almost a sure cropper, practically never failing to bear a profitable crop of very firm berries of good quality and appearance.

Plant **Gibson** for mid-season market and you cannot fail to be pleased.

Glen Mary

(Per.)—This variety was introduced in 1896 by W. F. Allen, of Maryland. We give part of his description:

"I do not recommend this sort for the South, but through the New England and Northern States I doubt if there is any variety that can equal it in every respect. It is only partially staminate but as its blossoms carry enough pollen to fruit its own berries it is listed as a staminate but I do not recommend it as a pollenizer for other sorts.

"Berries are large, dark red, with prominent yellow seeds, the meat is rich and juicy, red in color, and of very high flavor.

"Being very firm it is a good shipper and is a very popular market berry, commanding the highest prices.

"It has no particular choice of soils and needs no petting. The roots are long and well developed providing plenty of moisture during drouth. The foliage is large, upright in growth and of bright glossy green color.

"The fruit stems although large and strong are usually weighted to the ground by heavy clusters of berries."

Surplus Plants

It sometimes happens that we have a surplus dug of some varieties of Strawberry plants and rather than hold them over for another day to get stale we would prefer to ship them out at a lower price.

These cheap plants are first-class and generally of Standard sorts; our reason for offering so low is that after they are dug they soon deteriorate if held in the packing house.

If one is not particular about certain varieties, simply wanting good, standard sorts and will give their order for "Surplus" plants, we can furnish plants of our own choice for **\$4.00 per 1,000**.

We shall always send enough of Staminate sorts to properly pollinize the imperfect varieties.

Late To Very Late Varieties

Sample

(Imp.)—The introducer says: "Large size and fine quality; quite firm; continues a long time in fruit. The berries are large to the last. For the market-man it is the best strawberry ever grown. I have nothing in my grounds that will begin to fruit like it. It will yield as many berries as the Haverland, and will average as large as the Bubach. Colors all over at once. A berry that will do that is the best one yet found. There is not a weak spot in it. Foliage perfect, fruit perfect."

I feel perfectly safe in recommending this sort to my friends for either home use or market, where a late berry is desired. While we have a fair stock of plants I would advise ordering early as we always run short of Sample long before the close of the season.

Aroma

(Per.)—While fruit is quite similar to Gandy, the growth is very different, making fewer plants and stronger ones. The berries are large to very large, and hold up well to end of season.

It has been claimed to produce twice as much fruit as Gandy, but I would hardly think it probable, where both are grown under the same conditions. The quality of fruit is good, the color of the berry is against it where dark colored fruit is the standard of excellence, as it is more like Gandy, inclined to be light. I can personally recommend this sort to anyone wanting a late market berry. If large, bright colored berries, late in season, are an object to you, then try Aroma, and you will be pleased.

Brandywine

(Per.)—This has proved so satisfactory with all who have grown it that it is consequently in large demand. It is of great value by reason of its productiveness, large size, beauty and good quality, which renders it especially desirable for the home garden. The berries are glossy crimson, very handsome, firm and solid, excellent in quality, with fine aromatic flavor. The berries color all over evenly and retain a good size to the last, ripening in succession, and every berry maturing fully. Plant is remarkably vigorous, hardy and exceedingly productive and its foliage is long, clean and healthy.

Joe Johnson

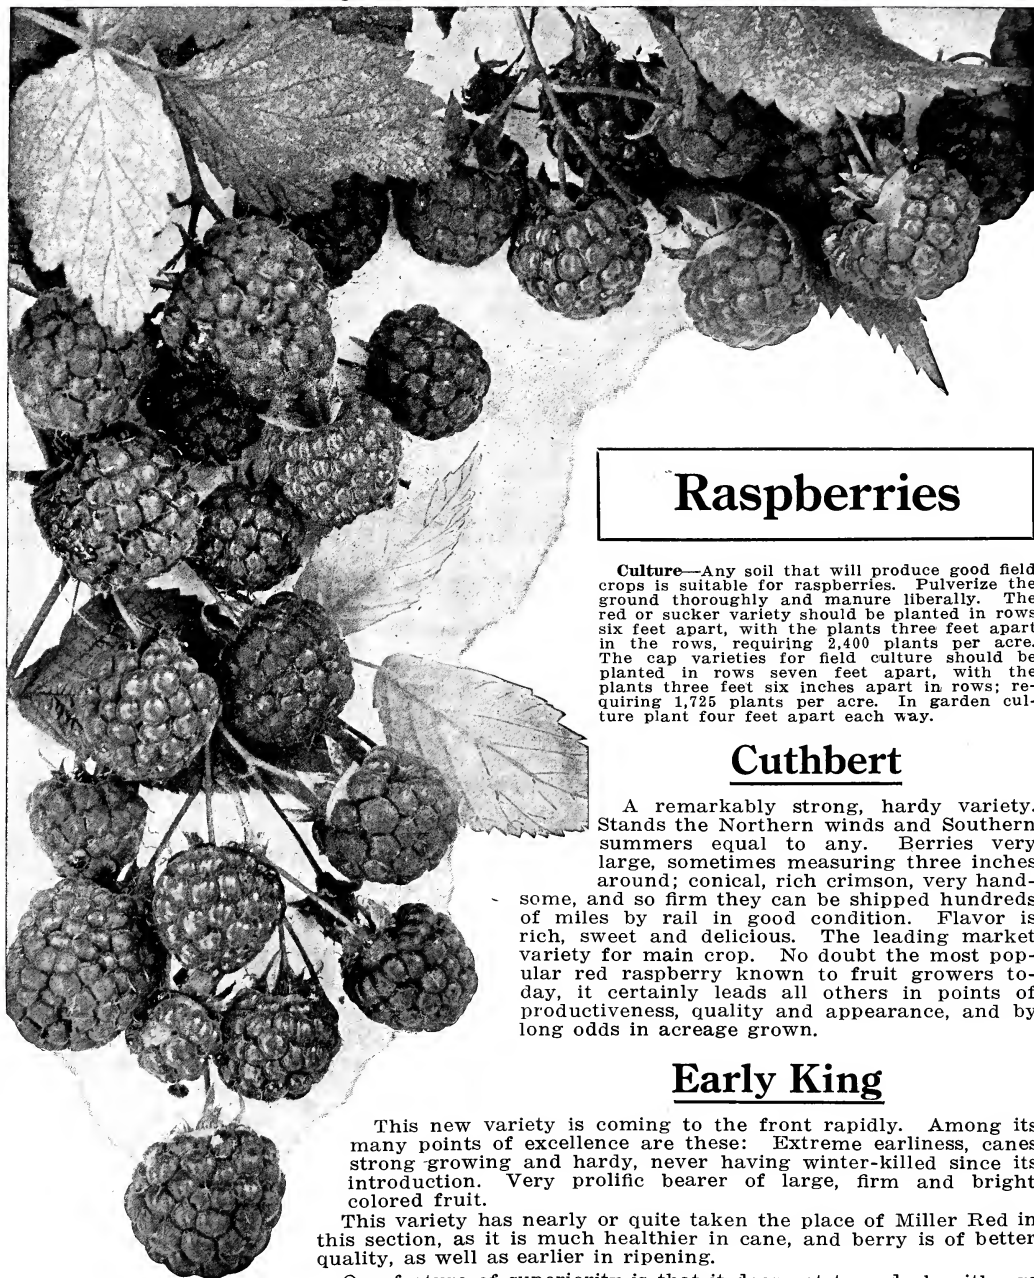

(Per.)—A new variety which gives promise of becoming one of the best late market sorts.

"This new berry originated in the southern part of Wicomico County, Maryland, about four years ago, and has been well tested. It ripens about the same time as the Chesapeake. The Joe Johnson is very productive of very large berries. It is a beautiful red berry with a bright green calyx, which adds greatly to its beauty and market value. Flavor is of the best; a perfect table and canning berry, and one of the best shipping varieties. Has a perfect flowered blossom and is a strong pollenizer. You will make no mistake in planting the Joe Johnson."

Rewastico

"The Rewastico is a highly colored, large, cardinal-red berry, and the color penetrates through and through; it is very productive and in size is uniformly large; in shape it is perfect and uniform as if turned out of a mould. In plant growth it is one of the healthiest on the farm, making plenty of large, strong plants, with an abundance of vigorous, luxuriant, dark green foliage; in quality it is rich, with an aromatic Strawberry flavor, though somewhat tart; but is firm enough to be very popular as a market berry. We consider it the only real competitor that the Chesapeake has ever had, and in some respects it even surpasses that exceedingly popular variety." Introducer's description.

➤ SEE PAGE 17 FOR PRICE LIST.

Raspberries

Culture—Any soil that will produce good field crops is suitable for raspberries. Pulverize the ground thoroughly and manure liberally. The red or sucker variety should be planted in rows six feet apart, with the plants three feet apart in the rows, requiring 2,400 plants per acre. The cap varieties for field culture should be planted in rows seven feet apart, with the plants three feet six inches apart in rows; requiring 1,725 plants per acre. In garden culture plant four feet apart each way.

Cuthbert

A remarkably strong, hardy variety. Stands the Northern winds and Southern summers equal to any. Berries very large, sometimes measuring three inches around; conical, rich crimson, very handsome, and so firm they can be shipped hundreds of miles by rail in good condition. Flavor is rich, sweet and delicious. The leading market variety for main crop. No doubt the most popular red raspberry known to fruit growers today, it certainly leads all others in points of productiveness, quality and appearance, and by long odds in acreage grown.

Early King

This new variety is coming to the front rapidly. Among its many points of excellence are these: Extreme earliness, canes strong growing and hardy, never having winter-killed since its introduction. Very prolific bearer of large, firm and bright colored fruit.

This variety has nearly or quite taken the place of Miller Red in this section, as it is much healthier in cane, and berry is of better quality, as well as earlier in ripening.

One feature of superiority is that it does not turn dark with age as does Cuthbert, but keeps its bright red color, although it will drop from the bushes if allowed to get over-ripe; this requires frequent picking. I would recommend this as the best early Red Raspberry grown.

Early King.

Ranere, or St. Regis Everbearing

This variety has been grown in New Jersey for several years by a colony of Italian gardeners and by them called **Ranere**. A few years ago, J. T. Lovett put it on the market, calling it "St. Regis." It is a sure-enough "everbearer," for after the fruiting canes finish their crop in summer it begins to bear on the tips of the new canes and with favorable weather it will ripen quite a "fall crop," continuing till killed by frosts. These same new canes live through the winter and bear a heavy crop during the next summer. In its original location it is considered profitable as a market sort, being one of the earliest to ripen. It is also very hardy, having withstood the coldest winters without injury.

We have a nice lot of plants of this variety that we can warrant genuine and we would advise all to test it, as we think it has merit, judging from the demand for plants, which increases each season.

SEE PAGE 17 FOR PRICE LIST.

Black or Cap Varieties

The "Scarff"

This new variety was first offered to the public as an "Improved Gregg," by W. N. Scarff, of Ohio, but to avoid confusing with the old variety of that name, it was thought best to change the name to "Scarff," after the introducer, whose description I will give: "In size it compares with the Cumberland, perhaps a trifle larger. In productiveness it is far ahead of any Black-cap we grow. It is absolutely hardy; canes free from disease and strong, upright growers. The canes are cleaner by far than any raspberry that we have ever seen, and we think it will stand heat and drouth better, making an abundance of good strong canes."

We fruited this variety in a small way the past season and think it will be superior to the old Gregg in productiveness although not quite so firm, as it is a more juicy berry.

Above is from description given in previous catalog and we can only add that the more we see of this variety the better we are pleased with its behavior. It certainly is a very healthy and strong growing sort, the canes being clean and bright and entirely free from that dread disease of Blackcaps, "Anthracnose."

Its manner of growth gives lots of bearing wood, making it a very prolific variety.

Plum Farmer

"This grand blackcap raspberry was found by us in a lot of blackcap plants received from Ohio some years ago. We have fruited it and sold plants from it for nearly fifteen years, and in all this time, while we have tried numerous varieties, we have never seen anything that could near approach it in value. The plants are fine growers, being more free from disease of blackcaps than other varieties; are clean silvery bluish in appearance when ripened in the fall, and when loaded in fruit are a sight to behold. It ripens very early and most of the fruit is produced in one week. It will outyield any blackcap we have ever seen. The fruit is very large, thick-meated and very firm, making a good berry to evaporate or ship to distant markets."—L. J. Farmer.

We have fruited this and find that it is easily the best blackcap we have growing today. Cane is healthy and strong growing, has many laterals, thus giving lots of bearing wood, insuring its heavy bearing, while the berry is very large and of fine quality.

Gregg

My experience is that Gregg is quite hardy on well drained soil, but does not love wet feet and winter-kills badly on wet ground. The berries are covered with a whitish blue bloom, which in its first dissemination was mistaken for mould or mildew and hindered the sale of the fruit on the market; but since becoming better known, this sort is very popular in all sections.

Cumberland

This has been named the "Business Blackcap" by the introducers, and has been loudly praised by all who have grown it. It is a very large berry of fine flavor, rich and sweet, and of jet black color with slight bloom. The cane is of extreme hardness, very strong growing and free from anthracnose.

It is a mid-season variety following the early sorts, but ripening ahead of Gregg.

Without doubt this is one of the most popular Black Raspberries grown today, there being perhaps twice the acreage set to Cumberland in this locality of any other sort.

This variety is especially adapted to the home garden as it is of the largest size and of excellent quality, covering a long season of ripening.

There is a great shortage of Black Raspberry plants for this season's trade on account of the severe drouth in the early Fall, making it very hard to get tip plants well rooted. We are especially short on Cumberland.

We have had to advance our price and still we expect to sell out early, in fact we could have sold our entire stock to the wholesale trade at very near our retail prices if we had cared to do so. We would advise all wanting these plants to place their orders early.

Cumberland Raspberry.

Purple Caps

Royal Purple

Originated in Indiana with a grower who says: "It surpasses anything I have ever seen in the Raspberry line. The original bush stands in a stiff blue-grass sod and has borne thirteen successive crops, and some of the time in winter the mercury has gone 35 degrees below zero. The bush is of healthy growth, and the fruit is of large size." The canes are model growers, vigorous and healthy, and the color of the bark is deep, rich red, being smooth except near the roots. The berries are purple in color, good shippers and good keepers; they do not crumble when picked.

This is the only purple variety we have to offer this year on account of the scarcity of all "tip" plants because of drouth in the early fall when these plants should have been layered.

We did however manage to get a nice lot of Royal Purple plants rooted and shall offer them at a reasonable price.

We fruited a small patch of this variety the past summer, although we usually cut the bearing wood back to the ground in the spring in order to encourage a stronger and healthier growth of cane for our propagating wood, and we were very much pleased with both yield and quality of fruit.

In quality the Royal Purple is more nearly like the Red Raspberry than either Columbian or Haymaker.

Some of our customers dislike to grow the Reds on account of the "suckers." To such I would recommend Royal Purple which does not sucker, but propagates from "tips."

This habit of growth is preferable when garden culture is given, where extra "suckers"—as the new plants of the Red Raspberry are called—become troublesome as weeds.

We find this an excellent variety for home use both canned and in its fresh state. It will well repay good treatment. Given good rich soil and proper care it will please all.

Royal Purple.

Blackberries

Blackberries should be planted in rows six or seven feet apart and three to five feet in the rows. Keep the ground light and rich. Pinch the canes back when they have reached the height of from two to three feet.

Our Blackberry plants are strong "Sucker" plants with good cross roots and are first-class.

The Productive Ward

Undoubtedly a seedling of the Kittatinny, which it resembles, having all of its good qualities and none of its defects. Healthy, strong grower with sturdy canes producing fine large fruit, black throughout, without core and of excellent quality. Have never suffered from winter injury in New Jersey. An exceedingly prolific sort, the bushes being covered with its fine fruit, producing as many bushels per acre as the Wilson in its prime.

Eldorado

In other years I have headed our list with Eldorado, but this time I am going to give it second place, as I think Ward is fully as good a berry in every way, and much more productive.

However, I do not mean to infer that Eldorado is not a first-class variety. For years it has been a standard of excellence in all points, with us; superior quality, large size, hardness of bud and cane, sells well in market as it is jet black and holds its color well, berry large and juicy, without core, entire freedom from Orange Rust, and a prolific bearer.

What more can we say? Try it yourselves, giving it a good strong soil, full of humus; prune and cultivate properly and my word for it, you will be pleased.

Grape Vines

The grape is one of the easiest fruits to grow and should be in all collections. When once well established, vines will continue in bearing a long time with very little care, other than the cutting back of the extra growth, which should be done in winter or very early spring (before sap starts to circulate). This pruning is essential to the healthy growth of the vine and its fruitfulness. The grape is fast becoming a leading fruit in our section of Michigan, and there is no reason why it should not be grown in many other sections of our country. With such hardy varieties as Concord, Worden, and Niagara, no one need be without at least a few for the home use, as the vines can be taken off the trellis for the winter, and if covered lightly with some kind of mulch will stand the extremes of our Northern climates.

Niagara (White)—Vine hardy, and unusually strong grower; bunches very large and compact, sometimes shouldered; berries as large or larger than Concord; mostly round, light greenish white, semi-transparent, slightly amber in sun, skin thick but tough, and does not crack; quality good; very little pulp, melting and sweet to the center.

Concord—A large, purplish black grape, ripening about the middle of September; vines remarkably vigorous and free from disease; the standard for productiveness and hardiness all over the country.

Worden—A splendid, large grape of the Concord type, but earlier, larger in bunch and berry, and of a decidedly better quality; vine harder than that old standby and every way as healthy. A very popular sort, planted largely for the market; next to Concord in number used.

Moore's Early—A black grape. Bunch large, berry round, quality better than the Concord; vine exceedingly hardy. Its earliness makes it desirable for an early crop, and more particularly adapts it for New England and the northern portion of the United States, maturing as it does ten days before the Hartford and twenty days before the Concord.

Brighton (Red)—Perhaps the best red grape in cultivation. Bunch large and compact, a strong grower and very productive; quality good.

Gooseberries

The same soil and conditions best adapted to currants will be appropriate for gooseberry culture. The American varieties of gooseberries are among our hardest plants. All of the standard sorts of the present day are cultivated forms of a native species natural to the upper Mississippi Valley, and in this region the cultivated sorts seem to reach their highest development. Clean culture should be given until the plants are well established, usually about the third year; after this they may be permanently mulched. As the best fruit is borne by the two and three-year-old wood, a certain amount of pruning will be necessary to encourage a strong growth of canes and in the removal of the older wood after bearing.

Downing.

Downing—This is without doubt the best gooseberry for general cultivation that is offered today. It is an American or Native seedling, not an English sort. The latter are very hard to grow successfully in this climate on account of weak foliage which is very susceptible to mildew. When this disease attacks the gooseberry it causes the foliage to drop before the berries are fully grown and materially injures the crop. Downing is a yellowish-green sort, and of good size, being a strong growing bush and a very prolific bearer. Plants of all varieties of gooseberries are in light supply and in very good demand, and the price is high.

SEE PAGE 17 FOR PRICE LIST.

Currants

Owing to a new fungous disease known as "White Pine Blister Rust" spores of which it is claimed live on Currant and Gooseberry foliage, the Federal Government forbids the shipment of either species West of the Missouri River.

Our customers will please refrain from ordering stock shipped to that locality. Our stock is grown where there has never been any of this disease found.

A cool, moist location is best for this fruit, and for this reason succeeds admirably when planted by a stone wall or fence; being benefited by partial shade. Plant in rows four feet apart, and the plants three feet apart in the rows. Keep the ground mellow and free from weeds and grass, using fertilizer copiously. Mulching is necessary for the best results.

Perfection—This new currant was originated by C. G. Hooker, of New York State, by crossing the Fay's Prolific with the White Grape Currant. It has the large size of the Fay, with the extra good quality and great productiveness of the White Grape. The color is beautiful bright red, and is less acid and of better quality than any other large currant in cultivation. Perfectly healthy, and a vigorous grower, and in fact the best currant for home use or market purposes under cultivation today. It has received a great many testimonials from the highest sources in this country. I think all who want a fancy fruit of this sort will do well to try this variety.

Wilder—A remarkable variety, for which we predict great popularity, both for table and market. One of the strongest growers and most productive. Bunch and berries very large, bright attractive red color, even when dead ripe; hangs on bushes in fine condition for handling as late as any known variety. Compared with the celebrated Fays is equal in size, with longer bunch, better in quality, with much less acidity; ripens at same time, continues on bush much longer; fully as prolific, in some trials largely outyielding it. Recommended by our Experiment Station as the best red currant.

Lee's Prolific (Black)—This is the leading variety of the black currant. Very heavy bearer of large bunches of fruit. Extra quality. Valuable for home use.

Asparagus Roots

When planting asparagus roots, set four to six inches deep, and about 12 inches apart in the row, covering with only three inches of soil at first, and filling in the trenches as the plants grow.

The asparagus bed is apt to be neglected in the early fall. Before the 1st of September the tops should be cut, and the bed or field cleared of weeds. It is highly important that all the seeds should be taken off, as the greatest enemy asparagus has in the way of weeds is asparagus, and it is almost impossible to get clear of superfluous plants, when once established. When this work is finished, cover the bed to a depth of three inches with coarse manure, which will not only enrich the soil, but will keep out the frost, which is highly essential.

The first work in the spring should be to remove all the covering except the fine manure, which should be carefully forked in, so that the crowns will not be injured by the tines of the fork. Forking the beds should not be neglected, as the early admission of the rain and sun into the ground induces the plants to throw up shoots of superior size. Another step in the right direction is to keep the ground entirely free from weeds the entire season, as these take from the plants the strength required for their own growth and the asparagus needs it all.

Palmetto—A valuable new variety and is being planted very largely. It is nearly twice the size of Conover, fully as early, and as productive. The flavor is excellent.

Hundred, \$1.25; thousand, \$7.00.

Rhubarb or Pie Plant

This deserves to be ranked among the best early products of the garden. It affords the earliest material for fine pies and fresh table sauce, continues long in use, and is valuable for canning. Make the ground rich and deep, as recommended for asparagus. Plant four feet each way.

Myatt's Linnaeus—Those who have never grown this variety, which is of superior quality, will hardly recognize the old "Pie Plant." It is an early, tender variety, without being in the least tough or stringy, with a mild, sub-acid flavor.

Good strong roots, 10 cents each; dozen, 75c; hundred, \$5.00.

SEE PAGE 17 FOR PRICE LIST.

Perennial Phlox

We still have a fine lot of this flowering plant which is being much used for background or border of lawn or home grounds.

It is very easy to grow, requiring little care or attention after first year, if given reasonably good soil or location.

Our stock consists of mixed Seedlings of blooming age, grown from an original bed of twelve choice named varieties, covering the different shades from **Salmon Pink** to very **Dark Red**, also including **Pure White** and **White with Marking of Red**.

These Seedlings are mixed as they grow and we cannot furnish special color, but will guarantee that in a dozen or more of the plants you will have a good assortment and that you will not be disappointed in the colors.

We are using a plain cut of this flower which does not show its beauty, but will give an idea of its appearance and manner of growth.

We are offering it as a premium with orders (see page 17). Regular sale price, **8c each**; **60c per dozen**, **\$4.00 per 100**.

In Closing

We take great pains to keep our plants **true to name**, and warrant them as such, and if any prove untrue, will either refund the money paid or replace with those which are true.

We cannot warrant plants to grow, for there are too many chances over which we have no control; we do warrant our plants to be packed to carry safely and to be in good growing condition when delivered to the carriers, after which our responsibility ceases.

Our strawberry plants are all fresh dug at time of shipping, as we do not try to winter any in cellar.

We wish to emphasize this statement, as in the past some have claimed that our plants have been held over winter in cellar. Let us say here that we never did this, nor have we ever seen others that practiced such methods.

In propagating strawberry plants for sale we always set from one-year-old beds which have not fruited. We also set different varieties in blocks of several rows each, thereby obviating the danger of mixture, liable where different sorts are set in alternate rows. In digging, we usually take up the entire row, discarding the original plants and such of the tip plants as are not well rooted, therefore, we have no exhausted stock to send out.

In digging strawberry plants our help work in the field when the weather is fit, lifting the plants with "potato hooks" when taking the plants from the soil, stripping off the surplus leaves and runners and tying in neat bunches of twenty-five (we always aim to put in twenty-six). After tying, the bunch is carefully heeled in until the required number of that variety is dug, thus the roots are not exposed to the air for any length of time.

Just a word as to varieties in closing. In **early strawberries**, we shall continue to recommend **Luther** as a general favorite, although **Campbell's Early** is a larger berry. Both **Dunlap** and **Warfield** are standard second earlies, while **Collins** and **Gibson** are best of the **mid-season** varieties, with **Sample** mated with **Brandywine** or **Joe Johnson** the best of the **very late** sorts.

In **Red Raspberries** we have nothing better than **King** and **Cuthbert**, covering the season from early to late; while **Plum Farmer** as early, and **Scarff** as late, are best of the **Blackcaps**.

Royal Purple, on good soil, is a superior sort, making a heavy yield of good quality berries. **Eldorado** is at present our most hardy and surest cropper of the **Blackberries**.

In **Currants**, **Wilder** is one of the best, while **Downing Gooseberry** is the only variety successfully grown in this vicinity.

Concord is the best **market Grape**, while **Worden** is of superior quality for home use.

We list many other good sorts of the different fruits, but mention these as being most satisfactory as grown by us.

SEE PAGE 17 FOR PRICE LIST.

Instructions to Purchasers

Read over very carefully before making out your order. Use the order sheet enclosed and sign your name very plainly giving Post Office, County and State.

OUR LOCATION—We are located in Southwestern Michigan, about fifteen miles south of St. Joseph, near Lake Michigan, in what is known as the "Great Fruit Belt."

RAILROAD CONNECTIONS are good. Our line of road, the Pere Marquette, runs mail and express trains direct to Chicago; time about three hours. Within fifty miles this line connects with the great trunk lines, east, west, north and south.

TELEPHONE—Long distance telephone in our office.

PARCEL POST—We are now able to ship plants by Parcel Post, and within the nearer zones it is the cheaper method.

Within the first three zones, covering three hundred miles, the limit of weight is seventy pounds, while in all other zones the limit is fifty pounds.

With the varying zone rates and the uncertainty of weights it is practically impossible to tell in advance what the cost of transportation of each shipment will be; therefore we find it best to send plants C. O. D. for Parcel Post charges.

This costs an extra ten cents, but it is also an insurance, as these C. O. D. packages have to be receipted for, and are reasonably sure of reaching their destination, while many packages sent in open mail do not.

Where our customers live on R. F. D. routes with Parcel Post delivered at their doors, it is so much more convenient than having to go perhaps several miles to the express office, that to accommodate such we are willing to send in the manner described above.

However, we frankly admit that considering the perishable nature of live plants, we believe that express shipment is the safest and cheapest in the end, although it may cost a little more. We much prefer express shipments.

BY EXPRESS—This is the safest way to ship live plants, as it makes fast time with the least liability of delay.

During the past season we have had an unusual amount of complaint from delayed shipments, but think this was largely due to the congested condition of all transportation facilities on account of the great World's War in which our Nation was engaged.

At present all express companies have united under one management, covering the whole United States, and rates have been advanced somewhat. However, plants go as second class, and at twenty-five per cent. less than General Merchandise rates.

For large orders, or for long distance, express shipment is cheapest, and we think best.

FREIGHT—Early in the season we can ship by freight with comparative safety, but there is a possibility of delay and consequent loss. Parties ordering stock shipped by freight will have to take the risk, as we cannot be responsible for loss, if any, on stock shipped in this manner.

LOSS OR DAMAGE—If packages are broken or damaged upon arrival, or have been an unreasonable time enroute, our patrons should refuse to accept and pay charges on the same, but should place claim for their value at once with the agent at their end of the line.

SAFE ARRIVAL—We do not undertake to guarantee safe arrival by any of these modes of transportation, as we have no control of stock after it leaves our hands; however, it is to our interest as well as the interest of our customers, to have stock reach the purchaser in good condition, and we shall always endeavor to so pack and forward goods that they may prove satisfactory.

OUR PACKING is done in the best possible manner and under our personal care. We use light crates or baskets

with plenty of moss for packing strawberry plants, and barrels and boxes for other sorts, making no charge for the work or package. Our long experience in this line gives us a decided advantage in the matter of **safe packing**. We also have experienced help who have worked with us for several years. Of course, we do not claim infallibility, and are always ready to make reparation where at fault.

SHIPPING SEASON begins about April 1st, or possibly last week in March, and continues until about 1st to 10th of May, according as to whether the season is early or late.

TERMS—Not less than one-fourth cash with order, balance before stock is shipped.

REMITTANCES—May be made either by New York or Chicago draft, postoffice or express order, or where none of these may be had, by registered letter.

RATES—Fifty plants of one variety at hundred rates; or five hundred plants of one variety at thousand rates.

OUR PRICES as a general thing are very low, but on large lists we are sometimes able to give better rates, and invite all wanting large lots to write for estimates.

By large lots, we mean a quantity; ten to twenty thousand and up.

ORDER BLANKS—Use the order blank enclosed when ordering, being careful to write your name **plainly**, giving Postoffice, County and State, and do this every time you write. Also keep a **copy** of your order yourself. Be particular to say how goods are to be sent, whether by mail, express, or freight. All orders are acknowledged immediately upon receipt. If you do not receive an acknowledgment in a reasonable time, write again.

WHEN TO ORDER—Early, by all means. The rule generally is "First come, first served," also the early orders find full stock, while later some varieties are liable to be exhausted.

Our customers will please remember that the time for filling orders is short, and it would facilitate our work greatly if orders were sent before the rush.

PREMIUM OFFER—On all orders at catalog rates received during January and February with cash in full, we will allow a cash discount of five per cent, or for every dollar sent during those months you may order additional stock to the amount of ten cents.

SUBSTITUTION—In ordering please state whether we shall substitute some other variety in case the kind ordered is exhausted. If not forbidden, we claim the right to substitute something of equal value, but always label true to name. We always aim to substitute with a variety similar in quality and season, and always something listed at equal or higher rate.

GUARANTEE AND CONDITION OF SALE—While we take great pains to have stock true to name, and hold ourselves ready upon proper proof to refund money or replace any that proves untrue, it is mutually agreed that we shall not be liable for a greater sum than the amounts paid for such stock.

Every order received for articles named in this catalog will be received and executed on the above conditions only, and with the distinct understanding and agreement on the part of the purchaser that we shall in no case be liable for a greater amount than the sum originally paid to us for the stock in question.

REFERENCES—We refer to the Express Agent or Postmaster at Bridgman, Union Banking Company, of St. Joseph, or Bradstreet's Commercial Reports as to our standing and reliability. Parties writing to any of the above please enclose stamp for reply.

In making out your order please use the enclosed order sheet, writing your name very plainly, and giving Postoffice, County and State.

PREMIUM OFFERS

With a \$2.50 order for other plants at catalog rates I will include five **Perennial Phlox Plants**, or twelve with a \$5.00 order.

With an order amounting to \$2.50 I will include **12 Fall-bearing Strawberry plants** or with a \$5.00 order I will include 25 plants; with a \$10.00 order you may add 50.

With an order amounting to \$2.00 I will include **25 Collins Strawberry plants**; with a \$5.00 order, **100 Collins**.

With an order amounting to \$10.00 or more at catalog rates we will include a three year's subscription to the **American Fruit Grower**, a monthly devoted to fruit culture, which is published in Chicago at 50c per year, and well worth more.

With an order amounting to \$15.00 or more I will include one year's subscription to **The Garden Magazine**. As its name indicates it is devoted to the interests of the garden and farm. Each issue has excellent articles from able writers, and is well worth the subscription price of \$2.00.

Or on all orders amounting to \$5.00 or more you may add **10 per cent in stock from the list**.

Please Notice. These **Premium Offers** must be mentioned **when the order is sent**; also that in either of these offers the amount must be figured at the **catalog price** and **not** where a special price has been quoted; also **only one premium** with each order.

The Fall-bearing Progressive
